

CANADIAN LIGHT RAIL VEHICLE
AUGUST 1982 (RFC)

- VAPOR forced air ventilation and heating, thermostatically controlled to respond to both ambient and interior temperatures, with both fresh air makeup, and heat. Continuous circulation. Standby storage preheat feature.
- Backlit fluorescent lighting, battery powered.
- · Five safety windows.
- 10" bottom step height.
- VAPOR pneumatically operated doors.
- Door interlocks for both power and brakes.
- CANREP (Scharfenberg) coupler, with folding head.
- OTACO "Innovator" seats.

## **Principal Specifications:**

TTC 4000-4005 (SIG built; serials 001-Fleet numbers: Class L-1: 006 resp.) TTC 4010-4199 Class L-2: (Hawker-Siddeley built; serials 1181-1370) Seating 15,444 mm (50'8") Length over anti-climber 2.591 mm (8'6") Width over rub rails 3.365 mm (11'01/2") Height — to top of roof 3,685 mm (12'11/8") - to top of base 7.620 mm (25'0") Truck centres 1,829 mm (6'0") Truck wheelbase 660 mm (26") Wheel diameter 1,495 mm (4'10%") Track Gauge 10,973 mm (36'0") Minimum horizontal curve radius, coupled Minimum vertical curve 122 m (400') radius radii - convex 244 m (800') radius - concave 23,135 kg (51,000 lbs) Weight — Tare (WI) 30,075 kg (66,300 lbs) - Normal service (W4) (101 passgrs) 32,120 kg (70,800 lbs) - Crush (W5) (131 passgrs)

Single end control.

Motor rating: Two monomotors, 185 HP continuous each (at 400 CFM); peak of 245 HP in accln., 370 HP in braking (HP mode).

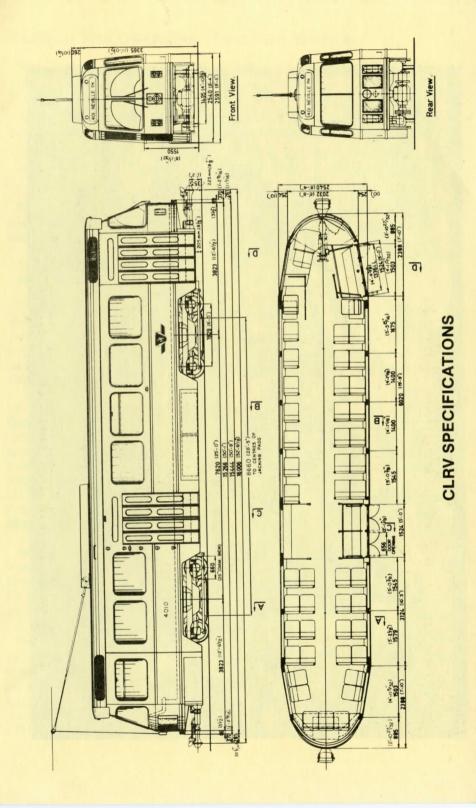

Initial acceleration rate: 1.47 m/s (3.3 MPHPS)

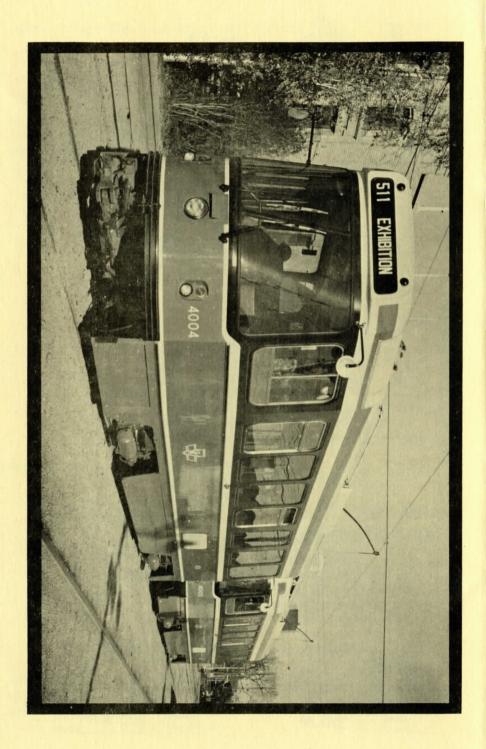

Time to maximum speed: 50 MPH in 30 secs. (HP) or 53 secs (LP)

Braking rate: 1.56 m/s (3.5 MPHPS) in service.

2.34 to 3.46 m/s (5.25 to 7.75 MPHPS) in emergency.

Jerk rate: 1.12 to 1.78 m/s³ (2.5 to 4 MPHPS²), depending on mode.

## CLRV — The Canadian Light Rail Vehicle

of the fleet.

The Canadian Light Rail Vehicle (CLRV) is the Commission's latest rail vehicle acquisition, and will be the replacement for an equivalent number of the PCC car fleet, whose average age is approximately 30 years.

When the Commission confirmed their intention to retain surface rail vehicle ("streetcar") operation in 1971, two parallel activities commenced:

1. "Heavy rebuild (overhaul)" of 173 PCC cars in 1972-1975.
2. Investigation of the acquisition of 200 new cars to replace the balance

The Urban Transportation Development Corp. (UTDC) was formed by the Government of the Province of Ontario in 1973, and (among their activities) it was mutually agreed that the Commission:

(a) would procure the new vehicles through the Corporation.(b) assist the Corporation in setting up the program.

This activity, underway in 1974, resulted in a world-wide examination of technology and designs available; their relation to the requirements (which were defined), not only of TTC, but of a number of other interested properties; contractual conditions for creation of a design (which would be the Corporation's to have manufactured and to market); and the provision of prototypes.

In August, 1975 the Commission, after review of the financing with the Governments of the Province, and of Metropolitan Toronto, accepted the Corporation's offer to provide 200 CLRV's. UTDC contracted all major sub-systems directly with the vendors; the design contract (and manufacture of 10 prototypes) was awarded to the Swiss Industrial Company (SIG). (The prototypes were subsequently reduced from 10 to 6 to assist UTDC to subsequently produce two articulated CLRV demonstrators). Production of the balance of 190 cars was awarded by UTDC to Hawker Siddeley Canada Limited in November 1977.

Tests in Europe were conducted at the OBB/UIC climate chamber in Vienna with car 001, with car 002 performing operational tests on the private Orbe-Chavornay Railway (near Lausanne), later joined by car 001 for MU testing. For this purpose both cars were equipped with standard gauge trucks.

The first CLRV arrived on the Commission's property on December 29, 1977, with the last of the SIG cars arriving July 13, 1978. Deliveries of cars from HSCL to UTDC at Toronto commenced April 24, 1979, and the last car of the order for 190 was received on November 19, 1981. Cars were accepted by the Commission as follows: 6 (SIG) in September and December 1978; 11 in September and October, 1979; 72 in 1980; 99 in December 1978; 13 in September and Cotober, 1979; 72 in 1980; 99 in December 1981; and 8 in 1982, with the final car (4199) accepted February 22, 1982.

MTC for a period of up to 5 years. the Commission purchased 125 cars outright and leased 71 from the and Communication (MTC), the original financing was shared such that By agreement with the Province of Ontario's Ministry of Transportation

September 29) on Route 507 "Long Branch" followed by: Revenue service commenced September 30, 1979, (after ceremonies on

Feb. 29, 1980 — Route 511 "Bathurst"

Apr. 16, 1980 — Route 512 "St. Clair" (incl. "Earlscourt")

June 9, 1980 — Route 503 "Kingston Road"

Aug. 7, 1980 — Route 502 "Downtowner"

Jan. 4, 1981 — Route 501 "Queen"

Oct. 23, 1981 — Route 505 "Dundas" and Route 506 "Carlton" July 20, 1981 — Route 504 "King"

## The CLRV provides a design that

- is produceable in, and marketable from, Canada.
- uses "state of the art" technology.
- provides new levels of comfort and convenience for passenger and
- vehicle operator.
- maintainability. • is based on conforming to quantitative standards of reliability and

operational in late 1984. adopt the UTDC Intermediate Capacity Transit System (ICTS), to become open in late 1982. In June, 1981 the Commission changed this program to the Light Rapid Transit (SLRT) line, approved in 1977 and scheduled to two of the cars, equipped with a pantograph, were to have been used on or city service, or high performance (HP) on private right-of-way. Twenty-The car is equipped to operate in either low performance (LP) for street

## Principal Features

- GARRETT chopper control.
- KNORR pneumatic disc brake (spring applied).
- over rheostatic, with disc brake blended as required. Service braking: Blended, with continuous preference to regenerative
- Track braking: In 3 steps, supplemental to service brake.
- tion and braking. • Load weighing: Rate maintenance to 71,000 lbs. (W-5 load) in accelera-
- Speed governor control: at 50 MPH, with overspeed penalty brake Spin/Slide control.
- application at 55 MPH.
- auxiliary controls, systems status indicators, and convenient circuit Elevated driver's position, with foot operated main controls, pushbutton Rubber and steel primary suspension, airbag secondary suspension.
- Electrically heated windshield. isolation and protection panel.
- . Turn and 4-way hazard signals.
- Rear view mirrors, both sides.
